DETAILED ACTION

Allowable Subject Matter

Claims 1-29 are allowed.

Reasons for Allowance

The following is a statement of reasons for indicating the allowable subject matter: the claimed invention is directed to a flat panel display. Independent claim 1 identifies a uniquely distinct feature "a first connecting member having a data driver that converts the RSDS specification into TTL data that generates for generating a column signal when the image data, the control signal, and the gray scale voltage are applied; a second connecting member having a scan driver that generates a scan signal when the control signal and the gate on/off voltage are applied". Independent claim 6 identifies a uniquely distinct feature "a first connecting member having a data driver that generates a column signal from the image data, the control signal, and the gray scale voltage, wherein the data driver comprises a decoder to decode the encoded digital data and the encoded digital control signal into TTL data; a second connecting member having a scan driver that generates a scan signal from the control signal and the gate on/off voltage". Independent claim 11 identifies a uniquely distinct feature "a control board including a gray scale generating part, a gate voltage generation part, power supply part and connected to the flat panel display with a plurality of connecting members, wherein the plurality of connecting members include a

plurality of column driver integrated circuits that receives RSDS signals from the encoder and decodes the RSDS signals into a TTL signal.

The prior art made of record and not relied upon is considered pertinent to applicant disclosure. Nakano et al. teach the liquid crystal display module of this embodiment also employs a digital interface as an interface with the computer side. Specifically, in this embodiment, display control signals including a clock signal CK, a display timing signal DTMG, a horizontal synchronization signal Hsync, a vertical synchronization signal Vsync, and display data (R, G, B) are sent from the computer side in accordance with a LVDS (Low Voltage Differential Signaling) scheme. Moon teaches a flat panel display system in which the interface for transmitting an image signal to a flat panel display device like a liquid crystal display module is accomplished by a low voltage differential signaling (LVDS) specification, to thereby reduce the number of components, transmission lines, and an electromagnetic interference (EMI). The closest art, Nakano et al. and Moon as discussed above, either singularly or in combination, fail to anticipate or render the above limitations obvious.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
